Arguments of Counsel. The debtor argues that the funds are exempt under 11 U.S.C. § 522(d)(12) as necessary personal effects of the debtor. The trustee argues that the funds are not exempt, because the debtor's sole occupation was that of a licensed real estate broker and that his sole profession is not encompassed within the exception to nonexempt property set forth in ORS 87.020(4)(a). A meta-analysis of the effects of a high versus low carbohydrate diet for weight loss and cardiometabolic health. This meta-analysis aimed to compare the effects of high versus low carbohydrate diets on weight loss and cardiovascular risk markers. We searched MEDLINE, Embase and Cochrane databases for randomized controlled trials with no restrictions on publication date. Eligible studies examined the effects of a low-carbohydrate diet, defined as less than 30% carbohydrate (fat  $\geq$ 60% and protein  $\geq$ 15%), versus a low-fat diet, defined as greater than 30% fat. Data on cardiometabolic risk markers were extracted and pooled in meta-analyses of changes from baseline to endpoint, and in each study. Ten studies with a total of 454 participants were included. Weight loss was not different between low-carbohydrate (standardized mean difference (SMD) = -0.18; 95% CI -0.55 to 0.19; I2 = 0%) and low-fat diets (SMD = -0.19; 95% CI -0.49 to 0.12; I2 = 0%). HDL cholesterol decreased (SMD = -0.31; 95% CI -0.64 to -0.01; I2 = 63%), and systolic blood pressure (SBP) increased (SMD = 0.71; 95% CI 0.14 to 1.29; I2 = 0%). T3/T4 ratio increased (SMD = 0.82; 95% CI 0.26 to 1.38; I2 = 0%) with the low-carbohydrate diet, but not the low-fat diet. We observed an increase in total cholesterol with the low-carbohydrate diet (SMD = 0.22; 95% CI 0.04 to 0.40; I2 = 0%). When data were adjusted for age, sex, and body mass index, low-carbohydrate diets were not significantly more effective than low-fat diets in terms of weight loss or cardiovascular risk markers. Our findings do not support the use of a low-carbohydrate diet to lose weight. However, increased SBP and higher T3/T4 ratio with the low-carbohydrate diet may raise concern regarding cardiovascular risk. OAKLAND, Calif.
