The company will manufacture and install a total of three systems, each including two lithium ion batteries and custom inverters, as well as three single-cell, lead-acid batteries for energy backup. Power output is expected to reach up to 10.8MW/129MWh, which will allow the project to supply up to 66,000 homes over a year. Commenting on the award, Mark Wakefield, Siemens substation products group business area manager, said: "Orion Solar has a proven track record of project success that sees it invest in solar power generation and energy storage. "This latest project underlines Siemens' commitment to developing energy storage for the distribution grid. "Siemens has already demonstrated that we can build a reliable supply of energy storage systems for energy facilities and they will be an integral component of solar power generation sites for many years to come." The storage systems were selected as they offer a range of safety and reliability features, which are designed to allow the sites flexibility and efficiency, the company said. The systems will help the plant to provide power to the distribution network, which was designed to manage electricity generated by a number of solar panels. Commenting on the results, Alex van Niekerk, Orion Solar Power's chief operating officer, said: "We have looked carefully at products on the market for years and we have selected Siemens as the preferred supplier because of its high-performance lithium ion technology. "The installation has been carefully planned for efficiency and we hope to have a long lifespan for the project."Bioengineering of the microenvironment: an overview of the molecular targets involved in neointimal formation following stent implantation. Restenosis, i.e., a re-narrowing of the inner arterial lumen that occurs following coronary stent implantation, remains a limitation to the widespread use of this technology
