Changes in serotonin turnover in rat brain following sub-chronic exposure to diethylstilbestrol. In the present study we have investigated the effect of sub-chronic exposure to diethylstilbestrol (DES), a synthetic estrogen, on serotonin metabolism in various regions of the rat brain. DES (1 mg/kg daily s.c. for 14 days) produced significant decreases in brainstem and hypothalamic serotonin turnover and increases in cerebral cortical and hippocampal serotonin turnover in comparison with those of the controls. These changes were more pronounced on Day 7 of the experiment, the effect declining by Day 14. All changes were statistically significant. These results suggest that sub-chronic exposure to DES may alter brain serotonergic neurochemistry as well as behavioural pattern."It's a great
